Total Access <u>etective</u>

One Database • Compare Tables,

Queries,

, Forms,

Reports,

Macros, Modules,

Find Differences Between Databases or Objects

Know Exactly What Changed

Whether it's two databases or two objects in one database. Total Access Detective quickly determines exactly what's different. Eliminate the guesswork and see your modified properties, fields, indexes, controls, sections, embedded macros, macros, and module code. Even compare data and combine records from two tables into a new one.

Object 1: frmExample1 Object 2: frmExample2

New Features!

- Access 2016 and 2013 (32 and 64-bit versions) support
- Detect new Access 2013/2016 properties & VBA/macro syntax
- New module and text comparison option to ignore line numbers
- See, filter and select tables based on whether it's linked or not
- Search bar filtering for object and property name selections
- More properties can be selected or unselected for comparisons
- List of procedures with changes
- Compare Data Macros
- Saves adjusted column widths
- New help file and user manual

"Final Verdict: I am once again quite confident in putting my stamp of approval on this tool. If you are in a situation in which you quickly need to identify all the differences between multiple databases, **FMS' Total Access Detective** will make short work of the job at hand! ... A very nice, easy to use and most importantly, effective and thorough tool"

Daniel Pineault Microsoft Access MVP Review

Total Access Detective understands VBA and doesn't get confused if you add, delete, or resort procedures. Unmatched procedures are listed, and lines in identical procedure names compared. Optionally ignore case, blank lines, indentations, comments and line numbering to quickly pinpoint exactly what changed in the "real" code.
